

– How did you approach the project?

I approached this project by creating a pseudo code chart to map out what I needed for the waiter and customer class. Then it was just a matter of doing the work which I decided to do in Java.

– How did you organize the project? Why?

I followed the tips and hints when working on this project. Instead of entirely focusing on one class, I focused on both classes at the same time to minimize the amount of bugs due to both of the codes being dependent on each other for development.

– What problems did you encounter?

I ran into a problem with the customer class due to some queueing order problems which would result in a wrong output.

– How did you fix them?

I just kept debugging until I got the right algorithm for the queue.

– What did you learn doing this project?

I learned about how threads work with each other and that you need to work on both parts from the ground up together.

– If you did not complete some feature of the project, why not?

* What unsolvable problems did you encounter?

* How did you try to solve the problems?

* Where do you think the solution might lay? · What would you do to try and solve the problem if you had more time?

I think I pretty much satisfied the requirements of this project.
